The surface of the skin is divided into specific areas called dermatomes, which are derived from the cells of a somite. These cells differentiate into the following 3 regions: (1) myotome, which forms some of the skeletal muscle; (2) dermatome, which forms the connective tissues, including the dermis; and (3) sclerotome,

which gives rise to t...

The temporomandibular joint (TMJ) or jaw joint is a bi-articular hinge joint that allows the complex movements necessary for life. The TMJ is the joint between condylar head of the mandible and the mandibular fossa of the temporal bone. This system is made up of the TMJ, teeth and soft tissue. This system plays a role in breathing, eating and speech.

Subclavius muscle (musculus subclavius) The subclavius muscle is a short, triangular muscle of the thoracic wall that lies underneath the clavicle. It originates from the first rib and courses laterally to insert on the undersurface of the middle third of the clavicle. The main function of the subclavius is to stabilize the clavicle during movements of the shoulder girdle.

The lingual tonsils are a collection of lymphatic tissue located in the lamina propria of the root of the tongue. This lymphatic tissue consists of the lymphatic nodules rich in cells of the immune system (immunocytes). The immunocytes initiate the immune response when the lingual tonsils get in contact with invading microorganisms (pathogenic bacteria, viruses or parasites).

The popliteal fossa (sometimes referred to as the hough, [1] or kneepit in analogy to the armpit) is a shallow depression located at the back of the knee joint. The bones of the popliteal fossa are the femur and the tibia. Like other flexion surfaces of large joints (groin, armpit, cubital fossa and essentially the anterior

part of the neck), it is an area where blood vessels and nerves pass ...
