The fire triangle or combustion triangle is a simple model for understanding the necessary ingredients for most fires.. The triangle illustrates the three elements a fire needs to ignite: heat, fuel, and an oxidizing agent (usually oxygen). A fire naturally occurs when the elements are present and combined in the right mixture. A fire can be prevented or extinguished by removing any one of the ...

4.3. Combustion performance. Fig. 12 shows the comparison of the HRR and the in-cylinder pressure. Before 5°C A ATDC, there was no significant difference of the HRR and the in-cylinder pressure, because the fuel spray did not hit the ring during the initial combustion. From 5°C A ATDC to 50°C A ATDC, the HRR with the FSD was higher than that without the FSD, which indicated that more ...
