Until the 19th century, linear algebra was introduced through systems of linear equations and matrices. In modern mathematics, the presentation through vector spaces is generally preferred, since it is more synthetic, more general (not limited to the finite-dimensional case), and conceptually simpler, although more abstract.. A vector space over a field  $F$  (often the field of the real numbers ...

What is not so obvious, however, is that for any matrix  $A$ , . the row rank of  $A$  = the column rank of  $A$ . Because of this fact, there is no reason to distinguish between row rank and column rank; the common value is simply called the rank of the matrix. Therefore, if  $A$  is  $m \times n$ , it follows from the inequalities in (\*) that. where  $\min(m, n)$  denotes the smaller of the two numbers  $m$  and  $n$  (or their ...
